"The periplasmic flagella of Serpulina (Treponema) hyodysenteriae are composed of two sheath proteins and three core proteins.";

J. Gen. Microbiol. 1381:2697-2706(1992).

-!- FUNCTION: Component of the outer layer of the flagella.

-!- SUBUNIT: THE FLAGELLUM CONSISTS OF AN OUTER LAYER COMPOSED OF TWO SHEATH PROTEINS, FLAA1 (44 kDa) AND FLAA2 (35 kDa) AROUND A CORE THAT CONTAINS THREE PROTEINS FLABI (37 kDa), FLABS (34 kDa) AND FLAB3 (32 kDa).
                                                                                                                                                                           Treponema hyodysenteriae (Serpulina hyodysenteriae).

(LUDW-) LUDWIG INST CANCER RES

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

peptide loop fragment from an exposed loop of a growth factor protein and cyclising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, covariant and the condition of the cyclisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, cerebrovascular accident, post-angioplasty restenosis, head, heat or cirauma, substance-induced neovascularisation of the liver, excessive trauma, substance-induced neovascular sequelae, hypertension induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to inage blood vessels and lymphatic or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VGGF, VGGF, cor -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and diabetic retinopathy

Identifying targeting peptides useful for treating e.g. diabetes mellitus, inflammatory diseases, cancer, or autoimmune diseases, comprises exposing a sample to a phage display library and recovering phage bound to the sample.

Claim 56; Page 288; 298pp; English.

```
.
0
                              targeting peptides. The method comprises exposing a sample from an organ, tissue or cell type of interest, to a phage display library and recovering phage bound to the sample (the phage expresses targeting peptides). The peptides identified by the method of the invention may have cytostatic, immunosuppressive, anti-inflammatory, antiarthritic, antiatheresclerotic, antidabetic, antibacterial and antiviral activities. The methods and composition are useful for identifying targeting peptides and one or more receptors for a targeting peptides. The targeting peptides are used for selective delivery of therapeutic agents, including gene therapy vectors and fusion proteins, to specific organs, trissues, or cell types in subject. The targeting peptide may also be used for treating diseases such as diabetes mellitus, inflammatory diseases, arthritis, atherosclerosis, cancer, autoimmune diseases, bacterial and viral infections and Hodyin's diseases. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to modulating agents for inhibiting or enhancing desmosomal cadherin mediated cell adhesion, comprising a modulating agent comprising a desmosomal cadherin cell adhesion recognition CAR sequence (ABB45341-ABB47262), a non-peptide mimetic of a desmosomal cadherin CAR sequence, a substance such as an antibody or antigen-binding fragment that specifically binds a desmosomal cadherin CAR sequence and/or a polynucleotide encoding a polypeptide that comprises a desmosomal cadherin CAR sequence can analogue. The modulating agents have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Desmosomal cadherin; cell adhesion; CAR sequence; immunosuppressive; cytostatic; antiapoptotic; wound healing; reduce scar tissue; skin graft; organ implant; autoimmune blistering disorder; cancer; apoptosis; cyclic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes a method for treating obesity or a lipodystropathy, which comprises: (a) obtaining a targeting peptide selective for adipose tissue; (b) attaching the peptide to a therapeutic agent to form a complex; (c) administering the complex to a subject; and inducing weight loss in the subject or treating lipodystropathy. The adipose targeting peptides have anorectic and antilipaemic activities, and can be used in peptide and gene therapy. The method is used for treating obesity or a lipodystropathy that is related to infection with human immunodeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as placental delivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for teartogenic activity. ABR56806 to ABR56227 and ACC79106 to ACC79111 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating obesity or a lipodystropathy comprises obtaining a targeting peptide selective for adipose tissue, attaching the peptide to a therapeutic agent to form a complex, and administering the complex to a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8
```

in size useful for targeting delivery to an organ or tissue, particularly disease, adisease, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. The peptide is also useful for inducing apoptosis, particularly to a subject with inflammation or macular degeneration. Furthermore, the peptide is useful for diagnosing the diseases cited above. Targeting peptides of the invention can also be used to deliver an agent to a foetus, by attaching a peptide to the agent and administering the peptide to a pregnant subject. Sequences ABG60326-ABG60574 represent selective targeting

peptides of the invention

Sequence 9 AA

The invention relates to an isolated peptide of 100 amino acids or less

endothelial cell binding protein; ECBP; anti-tumour; cytostatic; vasotropic; antipsoriatic; dernatological; ophthalmological; antidiabetic; antiathritic; vulnerary; antiulcer; antinflammatory; antibacterial; gynaecological; angiogenesis.

cell binding peptide SEQ ID NO:21.

Endothelial

(first entry)

The present sequence represents an endothelial cell-binding peptide motif. The peptide may be identified using the method of the invention. The specification describes a method for generating a peptide having a selected biological activity. The method comprises displaying the selected biological activity. The method comprises displaying the peptide display library, and using affinity selection to enrich the copulation display packages for those containing peptides which have copulation of specificity to the target cell. The method may be used in the selection of peptides having effects on cell proliferation, described shich have anti-proliferative activity with respect to one or more types of cells, peptides with (anti-) angiogenic activity, anti-cincetive peptides (e.g. which are active as anti-fungal or anti-cincetial), receptor protein effectors, and ligands for orphan receptors for which no ligand-receptor and channel interactions for cell surface-localized receptors and channels
                                                                                                                                                                Endothelial cell-binding peptide, Genetic display package, peptide display library, affinity selection, population display package, cell proliferation, cell differentiation, cell death, cell migration, anglogenic activity, infective peptide, anti-fungal; anti-bacterial; receptor protein effector.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Generating a peptide with a selected biological activity useful for identifying endothelial inhibitors and peptides with anti-angiogenic activity by combining peptide display libraries in a display and a
                                                                                                                                Amino acid sequence of an endothelial cell-binding peptide motif.

```
The invention relates to a novel isolated, synthetic or recombinant peptide or polypeptide which includes one or more endothelial cell peptide of the invention has anticumnary, cytostatic, vasotropic, antipsoriatic, dermatological, cumour, cytostatic, vasotropic, antipsoriatic, dermatological, antiulcer, autinflammatory, antidabetic, antiarthritic, vulnerary, antiulcer, cophthalmological, antidatestial, and gynaecological activity. The peptide is useful for promoting, reducing the proliferation and/or migration of the preferably the peptide, to promote proliferation and/or migration of the treated cells, and for reducing or promoting angiogenesis, by treating the cells with an BCBP antagonist, which is preferably the peptide of the invention is also useful for manufacturing a medicament for promoting angiogenesis, by admixing an ECBP agonist or ECBP antagonist to promote or reduce angiogenesis at one or more sites in a treated mammal. The medicament is useful for promoting or reducing angiogenesis. ECBP sequences are useful for promoting or angiogenesis. ECBP sequences are useful to alter the infectivity spectrum of a vizal particle. The present sequence represents an ECBP of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          <u>;</u>

The invention relates to colostrinin peptide fragments which are useful, inter alia, in the treatment of chronic disorders of the immune system and the central nervous system colostrinin peptides are used as a medicament in the treatment of neurological disorders e.g., dementia, neurodegenerative disorders e.g., Altheimer's disease, motor neuron disease e.g., Parkinson's disease, mental disorders e.g. psychosis and neurosis, in acquired immunlogical deficiencies, chronic bacterial and viral infections and diseases characterised by the presence of beta-dults and senile persons, who have been subjected to chemotherapy or have suffered from cachexia or weight loss due to the chronic disease.

Colostrinin peptides are also used as food additives and as an auxillary withdrawal treatment for drug additicts, after a period of detoxification and in persons dependent on stimulants. Colostrinin peptides are used to
                                                                                                                                                                                                                                                                                                      Colostrinin, nootropic, neuroprotective, immunomodulatory, antibacterial, Parkinson's disease, Alzheimer's disease, mental disorder, food additive, central nervous system disorder, weight loss; beta-amyloid plaque, psychosis; neurosis; cachexia; motor neuron disease; acquired immunological deficiency; neurological disorder; dementia;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide useful as an interalia in the treatment of e.g. disorders of the immune system and the central nervous system comprises ten amino-terminal amino acid sequence derived from peptides present in colostrinin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prepare antibodies and to treat emotional disturbances, e.g. emotional disturbances of psychiatric patients in a state of depression. These colostrinin peptides improves the development of immune system in a new born child and to correct the immunological deficiencies in a child. The present sequence is modified colostrinin cyclic peptide #10 related to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "N-terminal acetyl; this residue forms a cyclic
linkage with Ser found at the C-terminal end"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 26; DB 4; Length 9;

                                                                                                                               The present invention describes cadherin modulating agents (MA)

Comprising peptides which comprise a nonclassical cadherin cell adhesion

Comprising peptides which comprise a nonclassical cadherin cell adhesion

Comprising peptides which comprise a nonclassical cadhering

Comprising delivery of a drug to a tumour in a mammal, treating cancer in

commal, enhancing delivery of a drug to a tumour in a mammal, treating cancer in

commal, inhibiting metastasis of a cancer in a mammal, inhibiting

compressing cell, preventing or treating obesity in a mammal, simulating

compressing cell, preventing or treating obesity in a mammal, simulating

compressing cell, preventing or treating a demyelinating neutrological disease,

contral nervous system, treating a demyelinating synaptic stability in

conclassical cadherin-expressing cells, inhibiting synaptic stability in

conclassical adhering pregnancy in a mammal, required for can also be used for treating e.g. psoriasis, arthritis, age

conclassical adherin and pazzillal to AAV64572 represent specifically claimed peptides, and

AAV60592 to AAV64572 represent specifically claimed peptides, and

conclassical cadherin or prevention and diagnosis and in bioreactors

AAV60592 to AAV64572 represent specifically claimed peptides, and

conclassical cadhering the conclassical cadhering e.g. psoriasis, and pazzillal the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the concerns of the conc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .,

Endostatin targeting peptide #49.

(first entry)

15-JUL-2002

ABG35050;

```
The polypeptide sequences represent the 83P5G4-related protein and peptide fragments of the protein. 83P5G4 exhibits prostate specific peptide fragments of the protein. 83P5G4 exhibits prostate specific cypression in normal adult tissue, but it is also abservantly expressed in many cancers including tumours of the prostate, testis, bladder, kidney, brain, bone, cervix, uterus, ovary, breast, pancreas, stomach, rectum, colon and lung The 83P5G4 polymucleotide, its related protein and peptide fragments and specific PCR primers are therefore useful for diagnosing and treating cancer. A vector comprising a polymucleotide channespecifically binds to an 83P5G4-related protein, and a ribozyme capable of cleaving a polymucleotide having the 83P5G4 coding sequence, are both useful in the preparation of a composition for treating a patient with a cancer that expresses 83P5G4. The sequences can be used in diagnostic methods to monitor the level of 83P5G4 gene products in serum, blood, urine and continue and to thereby detect the presence of cancerous cells
                                                                                                                                                                                                                                                                           83P5G4-related protein; prostate; testis; tissue; cancer; bladder; liver; tumour; kidney; brain; bone; ovary; breast; panorceas; colon; lung; serum; cytostatic; gene therapy, antibody therapy; ribozyme; blood; cervix; single chain monoclonal antibody; utine; uterus; rectum; scomach; human;

```
This invention relates to a novel method for identifying disease

targeting peptides. The method comprises exposing a sample from an organ,

tissue or cell type of interest, to a phage display library and

recovering phage bound to the sample (the phage expresses targeting

beptides). The peptides identified by the method of the invention may

be to recovering phage bound to the sample (the phage expresses targeting

controlled to immunosuppressive, anti-inflammatory, antiarthritic,

antiatherosolerotic, antidiabetic, antibacterial and antiviral

activities. The methods and composition are useful for identifying

cartivities. The methods and composition are useful for identifying

cartivities are used for selective delivery of therapetuic agents,

including gene therapy vectors and fusion proteins, to specific organs,

tissues, or cell types in subject. The targeting peptide may also be used

for treating diseases such as diabetes mellitus, inflammatory diseases,

cartivities, atherosolerosis, cancer, autoimmune diseases, bacterial and

cartivities in control and Hodgkin's disease. The present sequence represents a

growth factor-1 (169-1) mutens of the invention. This sequence represents the N-terminal residues 63-67 of the IGF-1 mutein C67. The wild type IGF-1 sequence is represented by AAR8744. These muteins contain a non-native cystein residues substituted for one of the first (or last) four amino acid residues of this sequence. Polyethylene glycol (PEG) conjugates are then created from the muteins, where the PEG is attached to the non-native cystein residue. The PEG is attached to the free cystein through an activating group selected from maleimide, cate cystein through an activating group selected from maleimide. The conjugates can also comprise a second polypeptide attached to the PEG. The conjugates may be used for the treatment of IGF associated conditions, such as dwarfism, diabetes, periodontal disease or esteoporosis. Advantages associated with these conjugates are that they have a higher molecular weight, and an extended circulating half life in comparison to wild type IGF.
                                Insulin-like growth factor-1; IGF-1; polyethylene glycol; PEG; triflate; IGF-1/PEG conjugate; maleimide; sulphydryl; thiol; tresylate; aziride; exirane; 5-pyridyl; therapy; dwarfism; diabetes; periodontal disease; osteoporosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Endothelial cell-binding peptide, Genetic display package,
peptide display library, affinity selection, population display package;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Conjugates for treatment of, e.g. dwarfism, diabetes, or osteoporosis - comprising polyethylene glycol attached to mutein of IGF at free cysteine.

```
The present sequence represents an endothelial cell-binding peptide motif. The peptide may be identified using the method of the invention. The specification describes a method for generating a peptide having a selected biological activity. The method comprises displaying the peptide display library, and using affinity selection to enrich the population display package for those containing peptides which have containing peptides which have desired specificity to the target cell. The method may be used in the deletion of peptides having effects on cell proliferation, differentiation, death and migration, as well as in the identification of peptides which have anti-proliferative activity with respect to one or more types of cells, peptides with (anti-)angiogenic activity, anti-infective peptides (e.g. which are active as anti-fungal or anti-infective peptides (e.g. which are active as anti-fungal or anti-infective peptides (e.g. which are active as anti-fungal or anti-infective no ligand is known. Moreover, the method may be used to test functional ligand-receptor or ligand-ton channel interactions for cell surface-localized receptors and channels
cell proliferation; cell differentiation; cell death; cell migration; angiogenic activity; infective peptide; anti-fungal; anti-bacterial; receptor protein effector.
                                                                                                                                                                                                                                                                                                                                                                         Generating a peptide with a selected biological activity useful for identifying endothelial inhibitors and peptides with anti-anglogenic activity by combining peptide display libraries in a display and a secretion mode.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

New generically described peptides are disclosed which are NS3 protease inhibitors useful for treating hepatitis C virus (HCV) infection. The present sequence represents a specific example of these peptides. In a test to determine inhibition in a NS3 protease/NS4A cofactor peptide radiometric assay, this peptide had an ICSO value of 92 micromolar

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel isolated, synthetic or recombinant peptide or polypeptide which includes one or more endothelial cell binding protein (ECBP) sequences. A peptide of the invention has anticumour, cytostatic, vasotropic, antipsoriatic, dermatological cell tumour, cytostatic, vasotropic, antiarthritic, vulnerary, antiulcer, cantiniflammatory, antidabetic, antiarthritic, vulnerary, antiulcer, cophthalmological, antidabetic, antiarthritic, vulnerary, antiulcer, cophthalmological, cells, by treating, the proliferation and/or migration of endothelial cells, by treating the cells with an ECBP agonist, which is preferably the peptide, to promote proliferation and/or migration of the treated cells, and for reducing or promoting angiogenesis, by treating the cells with an ECBP antagonist, which is also promoting angiogenesis, by treating and medicament for promoting angiogenesis, by admixing an ECBP agonist or ECBP antagonist to promote or reduce angiogenesis at one or more sites in a treated mammal. The medicament is useful for promoting or reducing angiogenesis. ECBP sequences are useful to alter the infectivity spectrum of a viral particle. The present sequence represents an ECBP of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel synthetic or recombinant polypeptide useful for promoting, reducing proliferation and/or migration of endothelial cells, and for modulating angiogenesis, has endothelial cell binding protein sequences.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Patent No. 5747334
GENERAL INFORMATION:
APPLICANT: Kowlkes, D. M.
TITLE OF INVENTION: Totally Synthetic Affinity Reagents
NUMBER OF SEQUENCES: 186
CORRESPONDENCE ADDRESS:
ADDRESSER: Pennie & Edmonds
STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        44.2%; Score 23; DB 1; Length 8; 60.0%; Pred. No. 3e+05; 1; Mismatches 1; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    RESULT 15
US-09-258-754-373

19-09-258-754-373

2 Sequence 373, Application US/09258754

2 Patent No. 6174687

3 GENERAL INFORMATION:

3 APPLICANT: Ruoslahri, Erkki

3 APPLICANT: Rajotte, Daniel

3 TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using

4 TITLE OF INVENTION: Methods of Dipeptidase

5 TITLE OF INVENTION: Methods of Occupance of Identifying Lung Homing Molecules Using

5 TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using

6 TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using

7 TITLE OF INVENTION: Methods of Identifying Lung Homing Molecules Using

8 TITLE REFERENCE: P-LJ 3443

9 CURRENT APPLICATION NUMBER: US/09/226

9 EARLIER APPLICATION NUMBER: 09/042,107

10 SEQ ID NOS: 452

11 SEQ ID NO 373

12 LENGTH: 9

13 LENGTH: 9

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The complex proteolytic maturation which generates a variety of processed secreted forms with increased activity toward VEGFR-3 and VEGFR-2. First form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed VEGF-D is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PROSITE; P800249; PDGF 1; 1.

"Refined 1.7 A X-ray crystallographic structure of P-30 protein, an amphibian ribonuclease with anti-tumor activity.";
J. Mol. Biol. 236:1141-1153 (1994).
-1- FUNCTION: Basic protein with antiproliferative/cytotoxic activity against several tumor cell lines in vitro, as well as antitumor in vivo. It exhibits a ribonuclease-like activity against high molecular weight ribosomal RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         -!- CATALYTIC ACTIVITY: ATP + acetate = ADP + acetyl phosphate.
-!- PATHWAY: Conversion of acetate to acetyl-CoA; first step.
-!- SUBCELLUIAR LOCATION: Cytoplasmic (By similarity).
-!- SIMILARITY: Belongs to the acetokinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

Mol. Microbiol. 19:455-466(1996).
-!- FUNCTION: PROBBALY INVOLVED IN THE DEGRADATION OF METHYLATED OLIGOGALACTURONIDES PRESENT IN THE PERIPLASM.
-!- CATALYTIC ACTIVITY: Pectin + N H(2)O = N methanol + pectate.
-!- SUBCELLULAR LOCATION: Attached to the outer membrane by a lipid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pfam, PF01095; Pectinesterase; 1.

STRAIN=ATCC 48329 / C2;

OBSET B.M., YOGEV OC.;

Submitted (DEC-1997) to the EMBL/GenBank/DDBJ databases.

-!- SIMILARITY: Contains 2 zinc-dependent phorbol-ester and DAG binding domains.

-:- SIMILARITY: Belongs to the Ser/Thr family of protein kinases. PKC

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Description

(LUDW-) LUDWIG INST CANCER RES.

Stacker S, Hughes RA, WPI; 2001-442248/47. Achen MG,

Cendron A;

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis, consistent or Imphanojogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphanojogenesis, arthropathy, creterised by angiogenesis, neovascularisation or lymphanojogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, creterised by angiogenesis, neovascularisation of the liver, excessive creebrovascular accident, post-angioplasty restenosis, head, heat or clamma, substance-induced neovascularisation of the liver, excessive cremens, substance-induced neovascular sequelae, or chronic liver sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF vEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /note= "A disulfide bond forms between residue 17 and residue 17 of an identical peptide to form a dimeric peptide, to to residue 10 f the sequence appearing as AAU04528, also forming a dimeric peptide."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .,

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human conversed (ascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betaction distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptides (loop fragment from an exposed loop of a growth factor protein and cyclising the peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis,

The condition is diabeted retinopathy, psoriasing, arthropathy, characterised by angiogenesis, neovascularisation or lymphangiogenesis.

The condition is diabeter retinopathy, psoriasing, arthropathy, carebrovascular accident, post-angioplasty restenosis, head, heat or cold crauma, substance-induced neovascular sequelae, host of the liver, excessive conference in fection. The peptides are also used to modular vascular permeability in a mammal the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or by any and proved to interfere and interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or by interference or 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ·.
                                               Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VBGF. Or F.O and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and

```
The sequence represents a monometric monocyclic peptide or the invention, whose 3-dimensional structure is modelled on the expose loop of human beta carbon definition whose 1-dimensional structure is modelled on the expose loop of human beta carbon separation distances on opposite antiparallel strands of a cyclising the peptide by oxidising the periode by oxidising the monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenesis. The monocyclic peptides and a cyclic peptides with a least one amino acid deleted prior cyclisation are used to interfere with angiogenesis.

CC ovalisation are used to interfere with angiogenesis.

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC crebrovascular accident, post-angioplasty restenosis, head, heat or cold creama substance-induced neovascularisation of the liver, excessive creame, substance-induced neovascularisation of the liver, excessive confection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or branding and peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VECF. Cor-D and corruct inflammation, especially rheumatoid arthritis, psoriasis and disheric retrinomathy.
                                                                                                                                                                                                                                                                                 Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequence represents a monomeric monocyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                         Example 25; Page 47; 102pp; English.

(LUDW-) LUDWIG INST CANCER RES.

Stacker S, Hughes RA, Achen MG,

Cendron A;

Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine WPI; 2001-442248/47.

Example 26; Page 49; 102pp; English.

residues.

The Sequence represents a cumeric Discrete periods of human whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human consists of periods of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a cyclising the peptide by oxidising the eysteine residues. The monocyclic peptides dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with anglogenesis. The monocyclic peptides dimeric bicyclic peptides in a mammal with a condition characterised by anglogenesis, neovascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, heat or crebrovascular accident, post-angloplasty restenosis, heat or crebrovascular substance-induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver crauma, substance-induced neovascular sequelae, or chronic liver crauma, substance-induced neovascular sequelae, or chronic liver craumal has a condition of the liver, pleura, cin a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lumgs, peritoneal cavity, cor brain The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfece cutth at least one biological activity induced by VEGF or D and chabetic retinopathy certain with an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a channel of the peptides are used continual and and activity induced by VEGF or D and dabbetic retinopathy. The sequence represents a dimeric bicyclic peptide of the invention, diabetic retinopathy

The sequence represents a dimeric bicyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betace carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and conclusing the by oxidising the peptide by oxidising the monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclication are used to interfere with angiogenesis.

CC peptides) and a cyclic peptide with at least one amino acid deleted prior conclusion are used to interfere with angiogenesis.

CC peptides by angiogenesis, neovascularisation or lymphangiogenesis.

CC crecondition is diabetic retinopathy, psoriasis, arthropathy, carebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive cordification in peripheral limps or in lungs, peritoneal cavity, pleura, or brain. The peptides are also used to modulate vascular permeability in a communation in peripheral limps or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vesels and lymphatic contendiation. The peptides are used to image blood vesels and lymphatic contendiation in peripheral limps or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to image blood vesels and lymphatic contendiation and bicyclic peptides are used to interfere contendiation enterpretation with an anti-inflammatory agent, to treat a cordinal criminal activity induced by VEGF, VEGF, cordination enterpretation and proposition are also used in combination with an anti-inflammatory agent, to treat a characterized by activates and advanced to retrain and activation and archivation and activation archivation and activation and activation archiv diabetic retinopathy

residues.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-composed to a growth factor protein and peptide loop fragment from an exposed loop of a growth factor protein and composition the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior composition are used to interfere with angiogenesis, concuracterised by angiogenesis, neavascularisation or lymphangiogenesis in a mammal with a condition is diabetic retinopathy, psoriasis, arthropathy, contracterised by angiogenesis, neavascularisation or lymphangiogenesis and condition is diabetic retinopathy, psoriasis, arthropathy, contracterised manacolatic neovascularisation of the liver, excessive trauma, substance-induced neovascularisation of the liver, excessive commone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid
